1 A student has an electronic calculator. The calculator has a screen that displays the result of calculations.

The calculator has 8-bit registers.

(a) State the highest denary number that could be stored in a single 8-bit register.

.... [1]

(b) Denary numbers are typed into the calculator. They are converted to binary numbers and stored in the 8-bit registers.

The student types in the denary number 23 and the denary number 168.

Give the 8-bit binary numbers that are stored in the registers for these **two** denary numbers.

23								
168

....

....

(c) The result of a calculation that is stored in a register is the binary number 00001011

Give the denary number that will be displayed on the screen for this binary number.

00001011 .... [1]
