(d)
- Pour approximately half the water from the bottle into the beaker.
- Repeat **(c)(i)** and **(c)(ii)**.

h = ...

t = ...

a = ...
[2]

(e) It is suggested that the relationship between a and h is

$$a = \frac{kd\sqrt{\pi h}}{2}$$

where k is a constant.

Using your data, calculate **two** values of k.

first value of k = ...

second value of k = ...
[1]
