

- ① $(X = 1185): 1185/256 = 4.629$
- ② Rounding down to nearest whole number gives $Y = 4$
- ③ Multiplying by 256 gives $Z = Y * 256 = 1024$
- ④ The difference $(X - Z)$ gives the checksum: $(1185 - 1024) = 161$
- ⑤ This gives the checksum: 161

divide the sum, X , of the bytes by
256

round the answer down to the
nearest whole number, Y

$$Z = Y * 256$$

calculate the difference $(X - Z)$

the value is the checksum
