

(b) At the end of each sequence of pictures, the time is saved as a string in the format `<HH><MM><SS>` where:

- HH represents the hours using two digits
- MM represents the minutes using two digits
- SS represents the seconds using two digits.

For example:

- "081230" is stored to represent the time 8:12:30, in the morning
- "152235" is stored to represent the time 15:22:35, in the afternoon.

Each string is stored on a new line in the text file `TimeTaken.txt`

An algorithm is required to process the content of the text file `TimeTaken.txt` once it has been transferred to the computer.

For each hour when pictures are taken, output a suitable message showing the hour and the total number of sequences of pictures taken within that hour.

Example outputs:

Hour : 15 Total : 32
Hour : 18 Total : 1

Write pseudocode for this algorithm.

Assume the text file `TimeTaken.txt` contains at least **one** line.

This image shows a full page of white paper with horizontal dashed lines, typical of primary school handwriting practice paper. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.
