

(ii) A date is stored in `LastVisitDateString` in the format:

DDMMYYYY

DD is a 2-digit string

MM is a 2-digit string

YYYY is a 4-digit string.

For example, the date 03/09/2024 is stored as "03092024"

An algorithm is needed to convert the string stored in `LastVisitDateString` to data type `DATE` which is then stored in the variable `LastVisitDate`.

Complete the pseudocode for this algorithm:

Assume that `LastVisitDateString` has been declared and contains valid data.

```
DECLARE DayInt, MonthInt, YearInt : INTEGER
```

```
DECLARE LastVisitDate : DATE
```
