

(b) The class `Parrot` inherits from the class `Animal`

`Parrot` inherits the attributes from `Animal` and overrides the `Description()` method. The additional attributes and methods in the class `Parrot` are:

Parrot	
<code>WingSpan : Integer</code>	the width of the parrot's wings to the nearest cm
<code>NumberWords : Integer</code>	the number of words the parrot can speak
<code>Constructor()</code>	calls the parent constructor using its parameter values; initialises <code>WingSpan</code> and <code>NumberWords</code> to its parameter values
<code>ChangeNumberWords()</code>	takes an integer parameter and adds this to the number currently in <code>NumberWords</code>

- (i) Write program code to declare the class `Parrot`, its constructor and the method `ChangeNumberWords()`

Use your programming language appropriate constructor.

If you are writing in Python, include attribute declarations using comments.

Save your program.

Copy and paste the program code into part **3(b)(i)** in the evidence document.

[4]

- (ii) The method `Description()` in the class `Parrot` creates and returns a string of the animal's data in the format:

```
"The animal's name is " <Name> ", it makes a " <Sound> ", its size is " <Size> " and its intelligence level is " <Intelligence> ". It has a wingspan of " <WingSpan> "cm and can say " <NumberWords> " words."
```

For example:

```
The animal's name is Chewie, it makes a Squawk, its size is 1 and its intelligence level is 10. It has a wingspan of 30cm and can say 29 words.
```

Write program code for `Description()`

Save your program.

Copy and paste the program code into part **3(b)(ii)** in the evidence document.
