

(b) The class `LinkedList` stores the linked list.

LinkedList	
<code>HeadNode : Node</code>	stores the first node in the linked list
<code>Constructor()</code>	initialises <code>HeadNode</code> to a null value
<code>InsertNode()</code>	creates a new node using its integer parameter. Sets this node as the new head node and updates <code>NextNode</code>
<code>RemoveNode()</code>	finds the first node that contains its integer parameter and removes this node from the linked list
<code>Traverse()</code>	concatenates and returns the integer data in each node in the linked list

(i) Write program code to declare the class `LinkedList` and its constructor.

Do **not** declare the other methods.

Use your programming language appropriate constructor.

If you are writing in Python, include attribute declarations using comments.

Save your program.

Copy and paste the program code into part **3(b)(i)** in the evidence document.

[2]

(ii) The method `InsertNode()`:

- takes an integer as a parameter
- creates a new node with the parameter as the integer data
- uses the new node's method `SetNextNode()` to store the current `HeadNode` as the next node
- replaces `HeadNode` with the current node.

Write program code for `InsertNode()`

Save your program.

Copy and paste the program code into part **3(b)(ii)** in the evidence document.
