

- (b) The procedure `InsertData()` takes **five** positive integers as input from the user and inserts these into the linked list.

Each data item is inserted at the front of the linked list.

The table shows the steps to follow depending on the state of the linked list:

Linked list state	Steps
not full	insert the data in the index pointed to by <code>FirstEmpty</code> change the pointer to the index pointed to by <code>FirstNode</code> change the values of <code>FirstNode</code> and <code>FirstEmpty</code>
full	end the procedure

Any node that is at the end of the linked list has a pointer of -1 .

Write program code for `InsertData()`.

Save your program.

Copy and paste the program code into part **3(b)** in the evidence document.
