

- 5 A global 1D array `Num` of integers contains four elements. A program assigns values to these elements as shown:

```
Num[1] ← 1
Num[2] ← 2
Num[3] ← 5
Num[4] ← 3
```

A procedure `Process()` manipulates the values in the array.

The procedure is written in pseudocode:

```
PROCEDURE Process(Start : INTEGER)
    DECLARE CaseVar, Index, Count : INTEGER

    Index ← Start
    Count ← 0

    WHILE Count <= 20
        CaseVar ← Num[Index]
        CASE OF CaseVar
            1 : Num[Index] ← Num[Index] + Index //clause one
                Index ← Index + 1
                Count ← Count + 1

            2 : Num[Index] ← Num[Index] + Index //clause two
                Index ← Index + 2
                Count ← Count + 2

            3 : Num[Index] ← Num[Index] * 2      //clause three
                Index ← Index + 3
                Count ← Count - 1

            4 : Count ← Count + 4                //clause four
            OTHERWISE : Count ← 20
        ENDCASE

        Index ← (Index MOD 4) + 1

    ENDWHILE

ENDPROCEDURE
```
