

(b) A second module is defined:

Module	Description
LoansPerTutor()	- called with a parameter of type <code>STRING</code> representing a tutor ID (as a reminder, the first three characters of a <code>StudentID</code> represent a tutor ID) - returns an integer value representing the number of books currently on loan to students who have the given tutor

Reminder: unused elements have the `StudentID` set to an empty string. These may occur anywhere in the array.

Write pseudocode for the module `LoansPerTutor()`
