

- (b) The procedure `InitialiseHashTable()` initialises each element in the array to an empty or null record.

Write program code to declare the global 2D array `HashTable` and the procedure `InitialiseHashTable()`

Save your program.

Copy and paste the program code into part **3(b)** in the evidence document.

[2]

- (c) The function `Hash()`:

- takes an integer key field as a parameter
- calculates and returns the hash value of the key field.

The hash value is the result from the formula: `key MOD 100`

Write program code for `Hash()`

Save your program.

Copy and paste the program code into part **3(c)** in the evidence document.

[2]

- (d) The procedure `InsertData()`:

- takes an object of type `Record` as a parameter
- calculates the hash value for the parameter using the appropriate function
- stores the parameter in the correct position in `HashTable`

You can assume there will be no more than 10 objects that generate the same hash value.

Write program code for `InsertData()`

Save your program.

Copy and paste the program code into part **3(d)** in the evidence document.
