

(e) The file "HashTableData.txt" stores 200 key values and string data items in the format:

key, string

For example, the first row in the text file is:

528, permission

The key is 528 and the string data is "permission"

The procedure `ReadData()`:

- opens the text file and reads each line
- splits each line into the key and data
- calls `InsertData()` with an object containing each key and matching data.

Write program code for `ReadData()`

Save your program.

Copy and paste the program code into part **3(e)** in the evidence document.

[5]

(f) The function `GetRecord()`:

- takes an integer key field as a parameter
- calculates the hash value for the key field using the appropriate function
- searches the hash table for the record with the matching key field
- returns the data for the record if the record is found
- returns "Not found" if the record is not found.

Write program code for `GetRecord()`

Save your program.

Copy and paste the program code into part **3(f)** in the evidence document.
