

2 A program stores data about trains and train stations using Object-Oriented Programming (OOP).

The class `Train` stores the data about the trains:

Train	
<code>TrainIDNumber : String</code>	stores the train ID number
<code>Route : Integer</code>	stores the route number the train is travelling
<code>Constructor()</code>	initialises <code>TrainIDNumber</code> and <code>Route</code> to the parameter values
<code>GetTrainIDNumber()</code>	returns the train ID number
<code>GetRoute()</code>	returns the route number the train is travelling

(a) (i) Write program code to declare the class `Train` and its constructor.

Do **not** declare the other methods.

All attributes should be private.

Use your programming language appropriate constructor.

If you are writing in Python, include attribute declarations using comments.

Save your program as **Question2_N25**.

Copy and paste the program code into part **2(a)(i)** in the evidence document.

[4]

(ii) The methods `GetTrainIDNumber()` and `GetRoute()` return the appropriate attribute.

Write program code for `GetTrainIDNumber()` and `GetRoute()`

Save your program.

Copy and paste the program code into part **2(a)(ii)** in the evidence document.
