

- (ii) The method `AddTrain()` takes a `Train` parameter. The method compares the attributes `NumberTrains` and `NumberPlatforms` to identify if there is a platform available (a platform currently with no train).

The method returns `FALSE` if there are no platforms available.

If there is a platform available, the method:

- stores the `Train` parameter in the array `Trains`
- updates the appropriate attribute(s)
- returns `TRUE`

Write program code for `AddTrain()`

Save your program.

Copy and paste the program code into part **2(c)(ii)** in the evidence document.

[4]

- (iii) The method `GetTrains()` returns the string "There are no trains" if there are no trains at the station platforms.

If there are trains at the station platforms, the method returns a string in the format:

```
The trains at station <StationID> are:
<TrainIDNumber> on route number <Route>
```

The line `<TrainIDNumber> on route number <Route>` is repeated for each train at the station platforms.

For example: If the station with the station ID "NT1" has two trains with the train ID numbers "48RTG", "6UFH", the method will produce this output:

```
The trains at station NT1 are:
48RTG on route number 43
6UFH on route number 12
```

Write program code for `GetTrains()`

Save your program.

Copy and paste the program code into part **2(c)(iii)** in the evidence document.
