

- (iii) Between time $t = 0$ and time $t = 5.8$ s, the work done against resistive forces is 4.7×10^4 J.

Determine the average output power of the car during this time.

power = W [3]

- (iv) At time $t = 5.8$ s, the speed of the car becomes constant.

State and explain whether the output power of the car is greater than, less than or the same as the output power just before $t = 5.8$ s.
