

(d) Using the **larger** sheet of paper, repeat (a), (b)(i), (c)(i) and (c)(ii).

$$w = \dots\dots\dots \text{ cm}$$

$$d = \dots\dots\dots \text{ cm}$$

$$y = \dots\dots\dots \text{ cm}$$

$$p = \dots\dots\dots \text{ cm}$$

$$(y - p) = \dots\dots\dots \text{ cm}$$

[3]

(e) It is suggested that the relationship between w , y and p is

$$w = k(y - p)$$

where k is a constant.

(i) Using your data, calculate **two** values of k .

$$\text{first value of } k = \dots\dots\dots$$

$$\text{second value of } k = \dots\dots\dots$$

[1]

(ii) Justify the number of significant figures that you have given for your values of k .
