

- (d) • Pour approximately half the water from the bottle into the beaker.
- Repeat (c)(i) and (c)(ii).

$$h = \dots\dots\dots$$

$$t = \dots\dots\dots$$

$$a = \dots\dots\dots [2]$$

- (e) It is suggested that the relationship between a and h is

$$a = \frac{kd\sqrt{\pi h}}{2}$$

where k is a constant.

Using your data, calculate **two** values of k .

$$\text{first value of } k = \dots\dots\dots$$

$$\text{second value of } k = \dots\dots\dots [1]$$
