

- 2 A computer with a Von Neumann architecture has a central processing unit (CPU) that carries out the fetch-decode-execute (FDE) cycle.

(a) Give the name of the first register that is used in the fetch part of the cycle.

..... [1]

(b) The CPU has a control unit (CU).

(i) Describe the role of the CU in the CPU.

.....

 [3]

(ii) Give the name of the register that is part of the CU.

..... [1]

(c) The computer has primary storage. One example of primary storage is cache.

(i) Tick (✓) **one** box to show the correct statement that describes the purpose of cache.

A It stores important instructions.

☐

B It stores the next instruction to be processed.

☐

C It stores frequently used instructions.

☐

D It stores instructions so they are not lost when the power is turned off.

☐

[1]

(ii) Give **one** other example of primary storage.

Identify the type of data your example would store.

Primary storage

Data

..... [2]
