

(b) Identify **one** programming technique used in the algorithm.

..... [1]

(c) (i) The algorithm can accept a number between 1 and 255 inclusive as input.
Two validation checks that could be applied to `DenaryNumber` are a presence check and a type check.

Identify **one** other validation check that could be applied to `DenaryNumber`

..... [1]

(ii) Write the pseudocode to implement the validation check you identified in (c)(i).

You do **not** need to rewrite the whole algorithm.
