

- (ii) The CPU is changed to a dual-core 3.5 GHz processor.

Explain how the number of cores affects the performance of a CPU.

.....

.....

.....

..... [2]

- (iii) The amount of cache is increased to 64 kB.

Explain how the amount of cache affects the performance of a computer.

.....

.....

.....

..... [2]

- (c) The computer has both primary and secondary storage.

- (i) Random access memory (RAM) is one example of primary storage.

Describe what is meant by RAM.

.....

.....

.....

..... [2]

- (ii) Read only memory (ROM) is another example of primary storage. ROM often stores the start-up instructions for a computer.

Identify **one** other item of data that is commonly stored in ROM.

.....

..... [1]

- (iii) Some computers make use of virtual memory.

State the purpose of virtual memory.

.....
