

Question	Answer	Marks
3(c)(ii)	One mark from: • Serial • Parallel One mark from: • Half-duplex • Full-duplex • Simplex Any four from (for descriptions matching transmission types given): serial • Serial would send <u>bits</u> in order // serial uses only one wire. • ... so won't be skewed // less likely to have errors • Serial transmission speed would be adequate. parallel • Parallel would transmit data faster. • ... as multiple <u>bits</u> are sent at the same time // ... as multiple wires are used. • For parallel, chance of skewing/errors would be low as short distance transmission only required. half/full duplex • To allow data to be sent in both directions • ... so any interrupts/notifications for errors can be sent back to the computer. simplex • Data only needs to be sent one direction // Data transmission doesn't need to be two-way. • ... as the printer may not need to send errors back to the computer	6
